

Introduction:

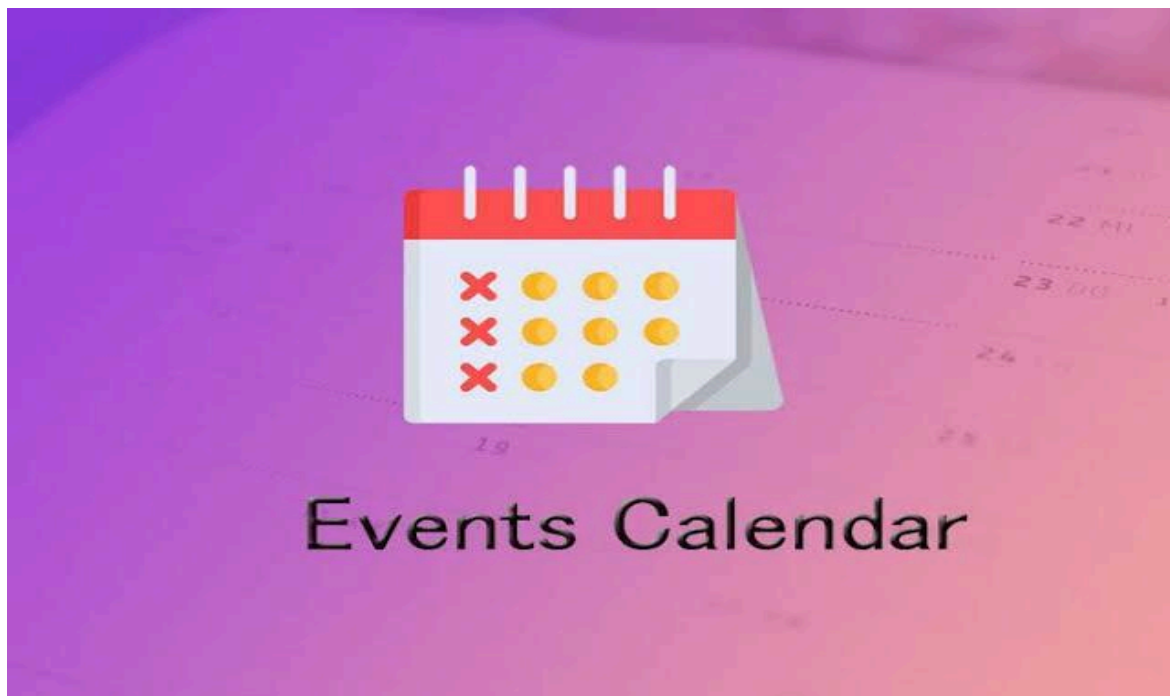

An Events Calendar can be used on your website, to show your visitors the events based on dates on your website. It is an organized way to show the upcoming events based on calendar dates. The primary practical use of a calendar is to identify days: to be informed about or to agree on a future event and to record an event that has happened. Days may be significant for agricultural, civil, religious, or social reasons.

What is calender?

A calender is a series of hard pressure rollers used to finish or smooth a sheet of material such as paper, textiles, or plastics. Calender rolls are also used to form some types of plastic films and to apply coatings. ... Calendrers are sometimes mis-spelled calendars.

Use Of calender-

Out-of-the-box designs that match your theme's look and feel. Fully responsive and mobile-friendly monthly grid and list views. Customize event content display using simple tags. ... Integration with Event Calendar Newsletter for quickly turning your events into a newsletter-friendly format.

- **Step 1 : Create a File to Display Calendar**

First create an index.php file and include FullCalendar required JS and CSS files in it. This FullCalendar plugin comes with different layout. See below HTML code example. This will create an event calendar with month, week, and day data. In jQuery script 'events' attribute is used to show all events data. This data comes via MySQL database in the JSON form and render it on the calendar. In the next step, we will create a database table to save events data.

```
<!DOCTYPE html><html>
<head><meta charset='utf-8' />
<link ='stylesheet' />
<link href='fullcalendar.print.min.css' rel='stylesheet' media='print' />
<script src='lib/moment.min.js'></script>
<script src='lib/jquery.min.js'></script>
<script src='fullcalendar.min.js'></script>
<script>$(document).ready(function () {
    Var calendar = $('#calendar').fullCalendar({
Header: {
Left: 'prev,next today',
Center: 'title',
Right: 'month,basicWeek,basicDay'
},
navLinks: true, // can click day/week names to navigate views
editable: true,
eventLimit: true,
    events: "all_events.php",
    displayEventTime: false,
    eventRender: function (event, element, view) {
        if (event.allDay === 'true') {
```

```

        event.allDay = true;
    } else {
        Event.allDay = false;
    }
}
});
});
</script>
<style>
    Body {
        Margin: 40px 10px;
        Padding: 0;
        Font-family: "Lucida Grande",Helvetica,Arial,Verdana,sans-serif;
        Font-size: 14px;
    } #calendar {
        Max-width: 900px;
        Margin: 0 auto;
    }
</style>
</head>
<body>
    <div id='calendar'></div>
</body></html>

```

To take input from user, we used window prompt() method. It will display a window where the user inputs event details.

Step 2 : Create MySQL Table to Save Dynamic Event-

Now create an MySQL database table to save dynamic events using with below query.All existed events will fetch from this database

```
CREATE TABLE `table_events` (
  `id` int(11) NOT NULL,
  `title` varchar(255) COLLATE utf8_bin NOT NULL,
  `start` datetime NOT NULL,
  `end` datetime DEFAULT NULL,
  `status` tinyint(1) NOT NULL DEFAULT '1' COMMENT '1=Active, 0=Block'
) ENGINE=InnoDB DEFAULT CHARSET=utf8 COLLATE=utf8_bin;
```

Step 3: Create Database Connection: Now create an database connection to execute all events functionality. Create a database.php file to make MySQL connection.

```
<?php
$conn = mysqli_connect("localhost","root","username","password");
if (!$conn)
{
  Echo "Failed to connect to MySQL: " . mysqli_connect_error();
}
?>
```

Step 4: Create CRUD Operation using jQuery

Now we write code to create CRUD operation using jQuery ajax. These operations are requested through AJAX using FullCalendar library callbacks. Create each event operation PHP file and upload it. Below are the code files require to create:

- All_events.php
- Add_event.php
- Delete_event.php
- Update_event.php

First, start with fetch all events using 'all_events.php' from a database table.

All_events.php : Show all Events in Calendar In this, we use PHP code to fetch all events data from MySQL database table in an array form. Now return the array data in JSON encoded format.

```
<?php
```

```
    Require "database.php";
```

```
    $json = array();
```

```
    $sqlQuery = "SELECT * FROM table_events ORDER BY id";
```

```
    $result = mysqli_query($conn, $sqlQuery);
```

```
    $alldata = array();
```

```
    While ($row = mysqli_fetch_assoc($result))
```

```
    {
```

```
        Array_push($alldata, $row);
```

```
    }
```

```
    Mysqli_free_result($result);
```

```
    Mysqli_close($conn);
```

```
    Echo json_encode($alldata);
```

```
$title = $_POST['title'];
```

```
$start = $_POST['start'];
```

```
$end = $_POST['end'];
```

```
$sqlInsert = "INSERT INTO table_events (title,start,end) VALUES ('".$title."','".$start."','".$end."')";
```

```
$result = mysqli_query($conn, $sqlInsert);
```

```
If (! $result) {
```

```
    $result = mysqli_error($conn);
```

```
} $id = $_POST['id'];
```

```
$sqlDelete = "DELETE from table_events WHERE id=".$id;
```

```
Mysqli_query($conn, $sqlDelete);
```

```
Echo mysqli_affected_rows($conn);
```

```
Mysqli_close($conn);
```

```
$id = $_POST['id'];
```

```

$title = $_POST['title'];
$start = $_POST['start'];
$end = $_POST['end'];

$sqlUpdate = "UPDATE table_events SET title=" . $title . ",start=" . $start . ",end=" . $end . "
WHERE id=" . $id;

Mysqli_query($conn, $sqlUpdate)

Mysqli_close($conn);

Function displayMessage(message) {

    $(".response").html("<div align='center' style='padding:20px;font-size:18px;color:#3539EA'
class='success'>" + message + "</div>");

    setInterval(function() { $(".success").fadeOut(); }, 2000);}

?>

```

Output: 1. Copy the link then paste chrome

https://codefixup.com/demo/event_calendar_jquery/

Conclusion:

Combine all crud event operations code in index.php script. Use 'eventClick' element to track the click action. Using this tutorial you can create event calendar using jQuery, PHP and MySQL for your web application and provide an intuitive way to manage all events data.
